

“We Said.” “He Said.”

We at HWH designed the Active Air Suspension to give RVers a more comfortable, enjoyable ride. The results have met our expectations and exceeded those of our customers. But don't take just our word for it. Duane Shaw had his own thoughts on Active Air after having it installed on his motorhome.

We Said:

Our Active Air Suspension lets RVers take the scenic route full of curves. The four-point electronically controlled suspension system provides ride comfort by rapidly adjusting the suspension system toward proper height and vertical angle. It senses and offsets lean for a more relaxing ride, whether on windy roads or winding paths.

In other words, Active Air allows you to take the road less traveled without worry. Active Air is no push-over when it comes to strong crosswinds and high-crowned roads, either. You can spend more time enjoying the scenery and less time fighting the lean. So relax and enjoy the journey.

He Said:

Active Air reduces body roll. It also reduces front-end dip on low speed cornering and eliminates front-end bottoming out on most highway dips. It counteracts the leaning of the coach when taking curves at highway speeds. Steering is easier and there is less wheel movement. The system makes traveling safer and more comfortable. It's definitely more fun to drive!

– Duane Shaw

If you want to experience Active Air's ride enhancement for yourself, visit us online or give us a call for more information.

Taking you to the next level.
