

# "For the Birds!"

More Than  
Just

When Al and Rita Jirsa decided to add the Active Air Suspension System to their new RV, they made the decision based on personal preference. Little did they know, a more level coach with less lean and improved handling would also satisfy their passengers—their birds.

According to the Jirsa's, Active Air provides a smoother, happier ride for their birds... and themselves... perhaps proving the system is something worth squawking about.

Check out a few of its advantages:

- Rapidly adjusts the suspension system toward proper height, even on high center crowned roads, rough surfaces, curves and windy conditions.
- Senses the driver's intention to turn and automatically adjusts levels while driving.
- Samples conditions every millisecond for immediate response to curves and side winds.
- Fuel economy mode saves fuel while on straight-aways.
- Manual over-ride allows the driver to raise or lower the vehicle to clear obstacles such as steep driveways or tree lines.

“We want to congratulate your company in making a great product—the Active Air System. We had the system installed on our new coach in August 2007. When we left, we drove through high winds and the RV handled like it was just a breeze. It also cornered without leaning. The roads were winding and before Active Air was installed, we had to take the turns at less than posted safe speed. After installation, we could take them at posted speed with ease. Where the highway was rough, we raised the unit and the bumps were less jarring.

When we parked for the night, we just activated the Air leveling system and were level almost instantly. In the morning, we were on our way in no time. The rest of our trip across the US was just as enjoyable.

The improvement in the ride and handling made it worth every cent. We would like to see the system as an option on all middle-priced RVs.

Again, thank you. Our birds thank you, too, as they enjoy the new, smoother ride!

Sincerely,  
Al and Rita Jirsa
