

HWH[®] Swivel Hand Pump with Hydraulic Switch Control

Available for Fifth Wheel, Horse & Specialty Trailers

Includes the following features...

- Hydraulic hand pump extends and retracts HWH[®] jacks or rooms with minimal effort. No electrical power is required.

The power unit is equipped with a manual two-stage hand pump which automatically shifts from high-volume with low-pressure to low-volume with high-pressure. This provides a rapid extend of the landing gear, but also gives you the power to lift a sizeable load.

The base of the hand pump swivels 180 degrees to allow more flexibility in mounting the controls.

- The hydraulic switches allow the operator to control the flow of hydraulic fluid. Each switch controls a jack or room.

Push a switch to the extend position, place the handle in the base and pump by hand to extend either a jack or a room.

Pull switch to the retract position and the jack or room will begin to retract (pressure is released). Pump on the handle to retract the room or jack.

- Hydraulic Switches allow the operator to slowly open the valves.

Controls have a feathering feature allowing the operator to control the retract speed in order to "feather down" the trailer when hitching.
